IT Agent – Quick Start Guide

What is it? IT Agent is a prompt (a set of working instructions) that turns an AI agent on your computer into a careful IT technician: it checks your computer, finds the real cause of a problem and suggests a safe fix, with documentation.

What you need

- A computer running Windows 10 or Windows 11.
- **Full mode:** Claude Code, Codex CLI or Gemini CLI – the agent runs the checks itself.
- **Chat only:** ChatGPT, Grok or Gemini (website or app) – the agent gives you one command at a time, you run it in PowerShell and paste back the result.

Getting started

1. **Install** the tool you chose.
2. **Create an empty folder** on your computer, for example `C:\IT-Agent`, and open it in the tool (not needed in chat).
3. **Paste the prompt** (the file `IT-Agent-prompt-v2.7.md`) as your first message.
4. **Choose a language** – Hebrew, English or any other. This is the first question, and from then on the agent replies in your language.
5. **Name your agent** – your own name for it, or one of the funny names it suggests, like "Agent Shuki". The name is saved, and you address it by name: "Agent Shuki, why is my computer slow?".
6. **Your IT experience** – the questions adapt to you: beginners get no technical questions and a simple mode (Quick). Experienced users can choose Full, which adds documentation, history and metrics.

In tools without buttons, answer in one line, or type OK to take the defaults.

Nothing runs until you choose

After setup, a menu appears: computer info, full health scan, quick security check, **drivers & updates check** (drivers, Windows updates and software updates), I have a specific problem, or nothing for now. It runs only what you chose, and says in advance what it will check and how long it will take. **The agent does only what you chose, then stops and offers options for what's next.** Choose "Nothing for now"? Whatever wasn't handled is saved in the **"For next time"** card at the top of the page, and next time the agent offers it in one click. Installing or updating a driver or software – only with your approval, one at a time.

Live documentation page

Right after setup, a local page (`reports\live.html`) opens and documents the work in real time: what the agent is doing and why, a timeline, plans with progress, findings, and before-and-after results. First you choose where the page opens: in the tool's built-in browser (recommended, next to the chat), in your regular browser, or not now – and the choice is saved. The history is kept, so you can read or print it later. At the end of setup, the agent designs an **employee card** in its own style (name, nickname, role, what it's allowed to do) – with no computer name, username or identifying details – and it appears at the top of the page. With one approval, it will also offer a shortcut with its name and a copy of the card on your desktop. In chat only there is no page – you get a short summary. **Approval is given only in the tool itself, not on the page.** Each action has a number (for example A1 or A2), and that's what you answer there.

Example: the employee card of "Agent Shuki". Yours will look different – every model designs it its own way.

Safety

- **Checking is read-only** – diagnosis changes nothing on your computer.
- **Nothing changes without your approval**, after you've seen the command, what it does and how to undo it.
- **Never give it passwords**, codes or keys. It doesn't need them.
- **Back up important data** before you approve any change.
- This is a personal, open project, and you use it at your own risk. **Full removal:** type "delete yourself" (or the Hebrew מחק את עצמך) – one confirmation, and it deletes only what it created.

I'd love to hear from you

Tried it? Tell me what worked, what didn't and what you'd improve – in a comment or a message.
